

Leveraged SQL to transform Zepto's product inventory data into actionable business insights, enabling data-driven pricing optimization, inventory planning, revenue analysis, and merchandising decisions. The project identified opportunities to reduce stock-out losses, improve promotional effectiveness, optimize category performance, and enhance operational efficiency through comprehensive exploratory data analysis.

Business Impact:

- **Enabled data-driven pricing decisions** by identifying products with the highest discounts and premium products with minimal discounts, helping optimize promotional strategies while protecting profit margins.
- **Reduced potential revenue loss** by identifying high-value out-of-stock products, allowing inventory teams to prioritize replenishment and improve product availability.
- **Identified high-performing product categories** through category-wise revenue estimation, enabling better inventory allocation and merchandising decisions to maximize sales.
- **Improved pricing competitiveness** by analyzing discount patterns across categories, helping the business balance customer acquisition with profitability.
- **Optimized inventory planning and warehouse operations** through weight-based product segmentation and inventory analysis, supporting more efficient storage, packaging, and delivery planning.
- **Enhanced customer value proposition** by identifying products with the best price-per-gram, enabling better product recommendations and increasing customer satisfaction.
- **Improved data reliability for business reporting** by cleaning invalid records, standardizing pricing data, and validating inventory information, ensuring more accurate analytical insights.
- **Demonstrated how SQL analytics can transform raw inventory data into actionable business intelligence**, supporting strategic decisions across pricing, merchandising, inventory management, and operations.
